

Sample PDF for Processing API

PDF Processing and Logging Test Document

This small PDF is designed for testing a PDF processing API. The API can use this file to verify that it can locate and open a PDF, extract its page count, and read basic document metadata.

Document Information

Field	Value
Title	Sample PDF for Processing API
Author	Jay Vekariya
Subject	Sample PDF for testing page count and metadata extraction
Keywords	PDF, API, logging, FastAPI, metadata, page count
Purpose	Testing PDF processing and API logging

PDF Processing Test Content

Purpose

The second page provides additional content so that the API has a multi-page document to process. A successful request should report a page count greater than one.

Expected API Processing Steps

1. Receive the POST request.
2. Validate the request_id.
3. Validate that the PDF path exists.
4. Open the PDF successfully.
5. Extract the page count.
6. Extract basic metadata such as title, author, subject, and keywords.
7. Log successful completion.
8. Return the extracted information in the API response.

Testing Notes

Sample Values

You can use a request body similar to the following when testing your API:

```
{ "request_id": "req_pdf_001", "pdf_path": "sample_pdf_for_processing_api.pdf" }
```

Logging Test

The API should generate status.log for normal processing messages and error.log when an exception occurs. Try both a valid PDF path and an invalid path to verify both logging paths.
